

A lot of non-technical founders think they don't need a CTO at all.

They truly believe that vibe coding, no-code tools is enough to start a tech startup.

Oh yeah, I know what's an API. I know what's a database.

There are tools to get these things. Voila. I'm a tech.

They truly believe the no-code platform will handle all of this for them.

But when asked: what happens when you scale to users beyond this region?

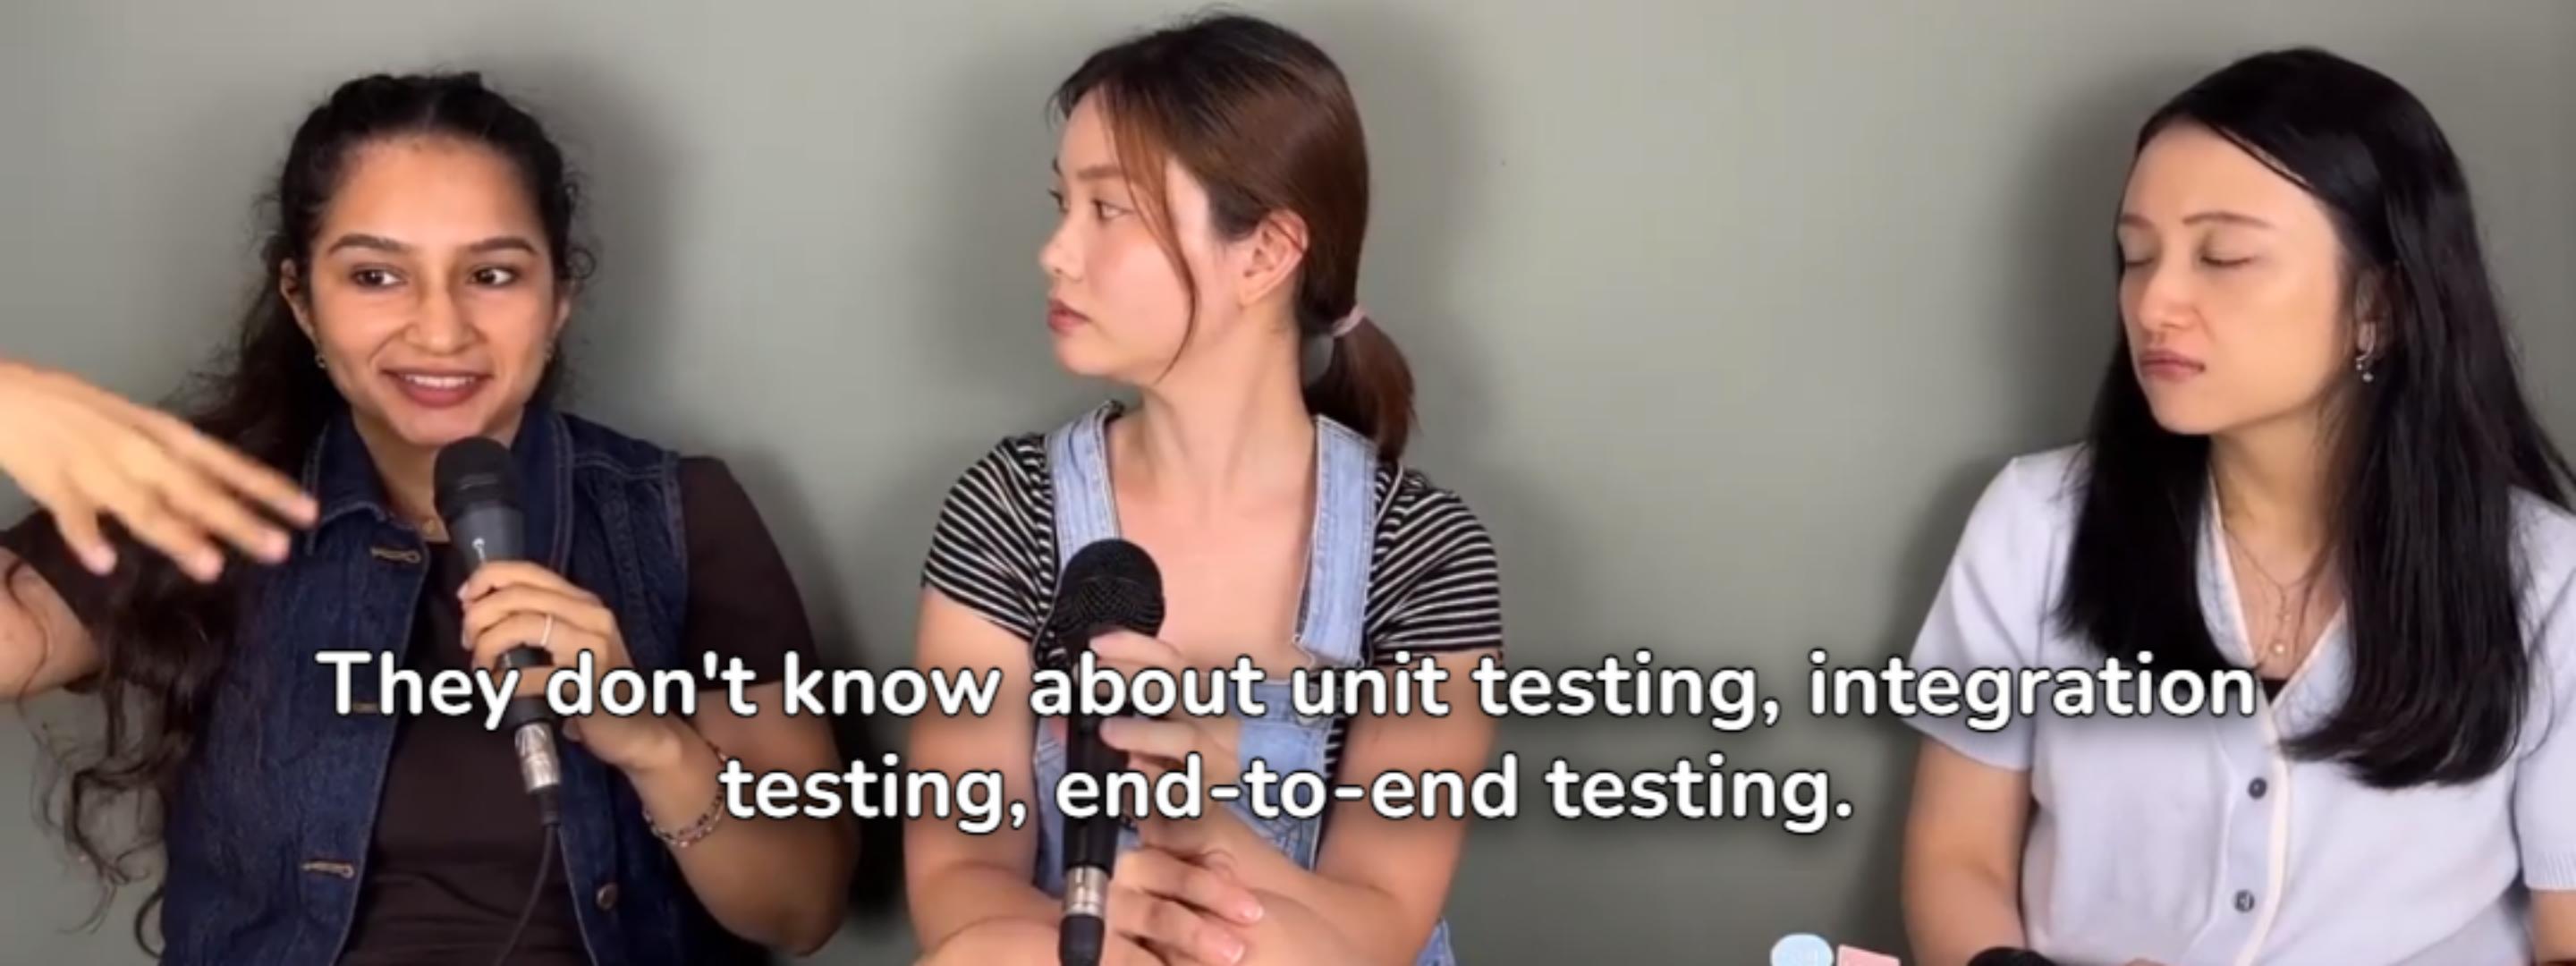

A lot of no-code platforms are just wrappers over existing AI models.

They aren't equipped to create apps that scale.

These founders have never worked in a tech company before.

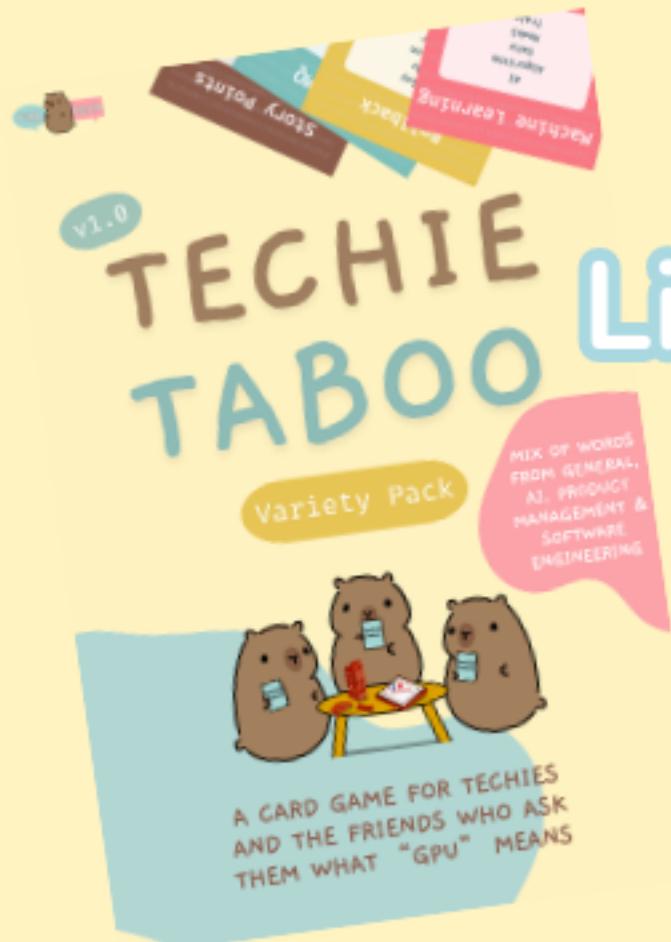

They don't know about unit testing, integration testing, end-to-end testing.
